IDMP(d)   **IDMP(d)**

NAME
        idmp — dump i-node

SYNOPSIS
        idmp [filesystem] i-number ... i-number

DESCRIPTION
        Idmp dumps the contents of the file described by the i-node numbered *i-number*. An arbitrary
        number of i-node numbers may be specified. The file system argument must be a special file
        name referring to a device containing a file system.

        Read permission is required on the specified file system device. The primary purpose of this
        routine is to dump the contents of a file which has an i-node allocated but no corresponding en-
        try in any directory.
